## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]  $\cdot$ [ $\sqrt{f}$ (GHz)]  $\leq$  3.0 for 1-g SAR and  $\leq$  7.5 for 10-g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- ullet Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

Worse case is as below: [2480MHz -3.49dBm (0.4477 mW) output power]

 $(0.4477 \text{ mW} / 5 \text{ mm}) \cdot [\sqrt{2.480 \text{ (GHz)}}] = 0.14 < 3.0 \text{ for } 1-g$  SAR

Then SAR evaluation is not required
